Umbrella topic:

Do the major crises of the 21st century require a change of system?

The climate crisis and the pandemic are on our minds. But what are ways out of the crisis? The *Fridays for Future* movement calls for a system change if there is no improvement possible within the current system.

But what could a better system look like?

Important remarks on the topic:

We want you to think outside the box. The system change is at the core of the topic. Ideas are to be developed that show what a new system of government, economic system, social system or mobility system might look like. So you should enter into new territory.

How can you get there? At the beginning, an in-depth analysis of the existing systems must be made. During the analysis, deficiencies, questionable basic assumptions and injustices may be noticed. Based on these findings, new ideas are to be formulated.

This is not the issue: Much-discussed instruments such as CO_2-taxes, road-pricing, etc. to improve the existing systems.

Subtopics for the four committees

Government 2.0

In the pandemic, many governments have been able to introduce new rules quickly with special laws, but they have also restricted the citizens' rights. Does this approach also work for the climate crisis? How and by whom should the state be led? Who should make decisions? Who should be responsible?

What does Government 2.0 look like?

Economy 2.0

We are all part of economy, we have private property, we produce and consume, buy and sell products, use up resources and accumulate waste. How could ecological and sustainable processes work? Do we need a new economic system?

What does Economy 2.0 look like?

Society 2.0

There are more and more people living alone. Our population is ageing due to demographic change. The number of people living in absolute poverty is decreasing globally, but the gap between rich and poor people is widening. How do we want to live? How do we want to grow old? Who is allowed to live in which way? Where do we need which limits? What rules are needed?

What does Society 2.0 look like?

Mobility 2.0

The degree of motorization and the distances travelled have increased enormously within the last 100 years. We commute from where we live to our school or workplace. We travel to far away countries and we also travel a lot in our free time. Goods and commodities are transported around the world. Around half of the CO_2-emissions in Switzerland are caused by transport. Is mobility a fundamental right? Or does mobility have to be fundamentally rethought?

What does Mobility 2.0 look like?
